Distributed Energy Resources: California vs. New York

October 6, 2017  University of Novi Sad, Novi Sad, Serbia

Outline

- What are DERs?
- DERs: penetration level in the USA
- DERs: types and applications
- DERs: California approach
- DERs: New York approach
- Summary
What are DERs?

A DER is any resource located on the distribution system.

- There is no single definition for a DER.
- Some technologies and services, such as residential rooftop wind or solar, easily fit into any definition but others do not.
- Examples of definitions of DERs by:
  - Public Utility Commissions (PUC)
  - Electric Power Research Institute (EPRI)
  - North American Electric Reliability Corporation (NERC)
  - Federal Energy Regulatory Commission (FERC)
DER Definition - PUC

California

“Distributed resources means distributed renewable generation resources, energy efficiency, energy storage, electric vehicles, and demand response technologies.”

New York

“DER is a resource, or a set of resources, typically located on an end-use customer’s premises that can provide wholesale market services but are usually operated for the purpose of supplying the customer’s electric load. DER can consist of curtailable load (demand response), generation, storage, or various combinations aggregated into a single entity.”

DER Definition - EPRI

“Distributed Energy Resources (DER) are electricity supply sources that fulfill the first criterion, and one of the second, third or fourth criteria:

1. Interconnected to the electric grid, in an approved manner, at or below IEEE medium voltage (69 kV)
2. Generate electricity using any primary fuel source
3. Store energy and can supply electricity to the grid from that reservoir
4. Involve load changes undertaken by end-use (retail) customers specifically in response to price or other inducements or arrangements.”

DER Definition - NERC

"A Distributed Energy Resource (DER) is any resource on the distribution system that produces electricity and is not otherwise included in the formal NERC definition of the Bulk Electric System (BES)."

- DER are located solely within the boundary of:
  - Any distribution utility
  - Distribution provider
  - Distribution provider-UFLS only

- DER includes any non-BES resource, such as:
  - Distributed generation
  - Behind the meter generation
  - Energy Storage Facility
  - DER aggregation
  - Micro-grid
  - Cogeneration
  - Emergency, Stand-by, or Back-Up generation

Source: NERC, Distributed Energy Resources Connection Modeling and Reliability Considerations, 2017

---

DER Definition - FERC

"Distributed energy resources is a source or sink of power that is located on the distribution system, any subsystem thereof, or behind a customer meter.

These resources may include, but are not limited to, electric storage resources, distributed generation, thermal storage, and electric vehicles and their supply equipment."

- Given the wide range of DER definitions, it is important that any adopted definition for DER be well-tailored to the purpose.

Outline

- What are DERs?
  - DERs: penetration level in the USA
  - DERs: types and applications
  - DERs: California approach
  - DERs: New York approach
  - Summary

DER Penetration Level

In 2016, DERs accounted for about two percent of the installed generation capacity in the United States

Data Source: EIA - Form EIA-860 detailed data files – Net - Metering February 2017
DER as Percent of the State Peak Load

Data Source: EIA - Form EIA-826 detailed data files – Net - Metering  February 2017

DER 5-year Growth

Installed Capacity 2012- October 2016, Top 5 States

Data Source: EIA - Form EIA-861 detailed data files - Net_Metering_2012-2016
DER: increasing adoption rate

DERs are being adopted at increasing rates due to:

- Favorable the state and federal policies
- Improvements in technology, and reduction in costs
- Becoming more widely accepted with identifiable customer benefits, both at the individual level and for the grid

Source: NARUC, Manual on Distributed Energy Resources Rate Design and Compensation, 2016

DER: benefits and challenges

Benefits

- Reduce monthly bill
- Improve reliability
- Defer the upgrade of distribution and transmission facilities
- Reduce the need for large generation facilities
- Reduce system losses
- May improve power quality
- Provide market services

Challenges

- Modeling
- Voltage and frequency ride through
- System protection
- Visibility and control
- Load and generation forecasting
- Coordination

DER: CA – How did it start?

- Assembly Bill 970 (2000) - Directed the CA Energy Commission (CEC) to provide incentives for distributed generation resources.
- SB 1 (2005) - The CEC would be required to adopt, implement, and finance a comprehensive solar program equivalent to one million solar roofs or 3,000 MW through IOU distribution rates by the end of 2016.
- In 2007, Go Solar California! is launched by CEC and CPUC.
- Clean Energy Job Plan (2011) - Set a goal to develop 12,000 MW of localized electricity generation and 8,000 MW of large scale renewables generation that require transmission lines by 2020.
- Assembly Bill 2514 (2010) - Directed the California Public Utilities Commission (CPUC) to adopt an energy storage program and procurement target.
- Rulemaking 10-12-007 (2013) - CPUC established an energy storage target of 1,325 MW by 2020 that has to be implemented by 2024.

DER: California - Section 769

Each utility has to submit a distribution resources plan proposal by July 1, 2015:

- Evaluate locational benefits and costs of DERs
  - Reductions or increases in local generation capacity needs
  - Avoided or increased investments in distribution infrastructure
  - Safety benefits and reliability benefits
  - Any other savings the DERs provide to the electrical grid or costs to ratepayers
- Propose or identify standard tariffs or other mechanisms
- Propose cost-effective methods to maximize the locational benefits and minimize the incremental costs of distributed resources
- Identify any additional utility spending necessary to integrate cost-effective DERs with the goal of yielding net benefits to ratepayers
- Identify barriers to the deployment of distributed resources

DER: CA - DRP Ruling

In 2015, the CPUC issued an Assigned Commissioner’s Ruling which identifies the supplemental goals for the DRP proposal:

- Supporting greenhouse gas (GHG) reduction targets
- Modernizing the electric distribution system to accommodate two-way flows of energy and energy services
- Enabling customer choice of new technologies and services that reduce emissions and improve reliability
- Animating opportunities for DERs to realize benefits through the provision of grid services

DER: CA – Hosting Capacity

Source: https://www.pge.com/b2b/energysupply/wholesaleelectricsuppliersolicitation/PVRFO/PVRAMMap/index.html
DER: CA - DER Aggregation Model

- In 2016, adopted tariff provisions that created a new market participant category called a distributed energy resource provider (DERP)
- DERP aggregates distributed energy resources to participate in the CAISO market and provide energy and ancillary services
- DER aggregations, meeting a 0.5 MW minimum capacity requirement, can participate in the CAISO day-ahead, real-time and ancillary services markets

DER: NY - Reforming the Energy Vision

- Why was it needed?
  - Cost-of-service paradigm
  - Few incentives for innovate
  - Efficiency and clean energy are funded through surcharges and programs that are not directly integrated with utility business models
- Central vision of REV - increasing the use and coordination of DER via markets operated through a Distributed System Platform Provider (DSPP)
DER: NY – REV

- Track 1: Implementation - developing DER markets and the utility as Distributed System Platform (DSP) provider
- Track 2: Regulatory and Ratemaking - reforming ratemaking practices for utilities and revenue streams for the DSP provider model.
  - Stepping away from the net metering
  - Value Stack mechanism, a new pricing mechanism, is based on avoided utility costs and DER values, including components for wholesale energy values, distribution system values and environmental values.
- In 2015, utilities filled proposals for the Distribution Service Implementation Plans (DSIP) process and rolled out pilot programs.

DER: NY – DER Road Map

- In 2017, NY ISO published a DER Road Map

Outline

- What are DERs?
- DERs: penetration level in the USA
- DERs: types and applications
- DERs: New York approach
- DERs: California approach
- Summary

Summary

- DER definitions need to be well-tailored to the purpose
- In 2016, DERs accounted for about two percent of the installed generation capacity in the United States
- The top five states are California, Arizona, New Jersey, Massachusetts and New York
- Main reasons for the increased DER penetration level: polices, technology improvement and reduced costs
- California and New York are solving the same problem using different approach
